

The Lifecycle of a Flowering Plant

1. Germination

The seed starts to grow when conditions are suitable.

2. Roots

Roots grow, usually underground.

3. Leaves

A stem and leaves form, and the plant makes its own food (photosynthesis).

4. Flowering

The pollen in the flowers is used to make seeds.

5. Seed Dispersal

Seeds are spread out so they can grow where they are not fighting for space with the parent plant.

Other Flowering Plants

Sunflower

Orchid

Tomato plant
