

# How to Make a Flexangle

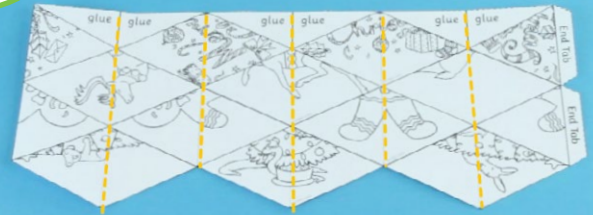

**Note:** For best results use thin card. Colour in each triangle of the flexangle. Make sure each triangle in a row is coloured in using the same colours. Each row can be different to one another, to make different patterns. All of the triangles in row A should look the same, all of the triangles in row B should look the same, and so on. You can also find a demonstration video [here](#).

1

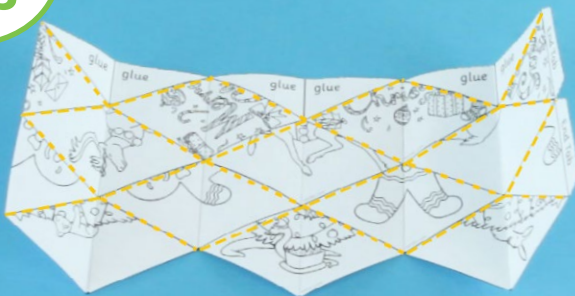

After colouring the flexangle, cut the whole flexangle out around the edge.

2

Fold the dashed vertical lines towards you (a “valley” fold). Crease them well, then unfold to make the flexangle flat again.

3

Next, fold all of the diagonal lines away from you (a “mountain” fold) and crease them well. Make sure you fold both diagonals! Unfold the flexangle again.

4

Add glue to the tabs marked ‘glue’ and press the tube together to help it stick.

5

Carefully wrap the flexangle into a tube-like shape, matching dot to dot.

6

Add glue to the end tab and tuck it into the open end of the tube. Press the ends together to make sure it sticks well.

7

Let your glue dry and then have a go at playing with your flexangle. Can you see all of your different patterns?
